DAY 21 · THEORY HANDOUT

Build Prompts With Reusable Templates

Fill named placeholders and inspect the messages before calling the model.

The idea and its useful terms

Fill named placeholders and inspect the messages before calling the model.

Template

A prompt pattern with named spaces to fill.

Placeholder

A name such as {topic} replaced by input data.

Input dictionary

Pairs each name with its chosen value.

A template keeps the task wording the same while input values change. This makes repeated tasks easier to compare.

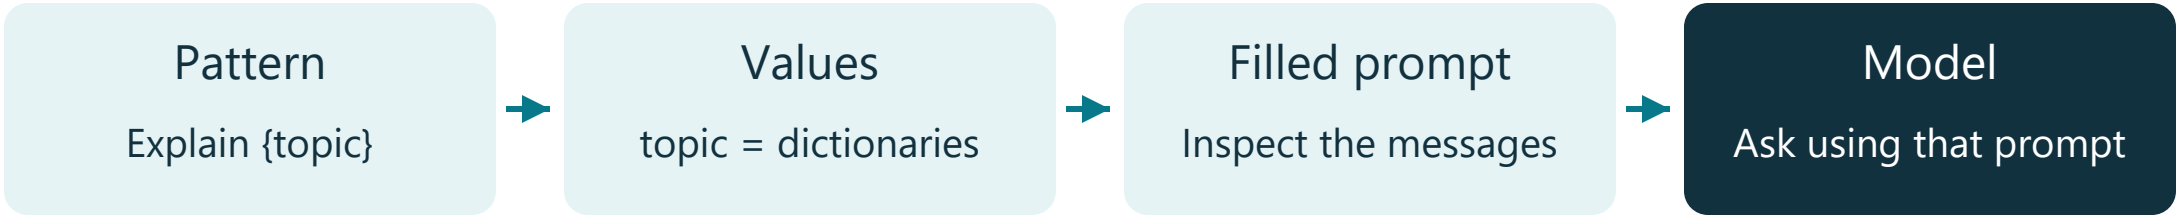

Inspecting a filled prompt reveals missing values and accidental instructions before we spend time on generation.

> A placeholder name is a Python input key. It is not a new fact the model learns forever.

Follow the work, one step at a time

Each step has a job. We can inspect its output before moving on.

Read the path from left to right.

Each arrow means: pass the result to the next step.

The template stores placeholders such as {topic} and {points}. We send a dictionary with those exact keys. Filling the template replaces the placeholders before the model receives the messages.

A missing key is a template error, not a bad model prediction. A literal brace must be escaped in a template. Keep user text as an input value rather than rebuilding template rules from it.

> If the answer is wrong, inspect the input and the intermediate results. The last sentence alone cannot show which step failed.

A small example we can check

The values here are classroom examples. The notebook shows actual results.

Template

Explain {topic} in
{points} short points.

Values

topic: Python lists
points: 3

Filled text

Explain Python lists
in 3 short points.

Read the given input first. Point to the fact or value needed for the requested output.

Run the matching example, then try the fresh input at the end of the notebook. Compare both results with the known input.

> A placeholder name is a Python input key. It is not a new fact the model learns forever.

05 KGP Talkie

Choose the setting or tool for its job

A different choice changes the work. These are the choices we compare.

String prompt

One block of text.

Good for a simple task.

Chat template

A list of role messages.

Good for steady rules.

Literal braces

Double braces in templates keep a brace as text.

Create a chat template with a system rule and a user question.

Fill it with two different topics. Display the filled messages first.

> Try the second topic as a fresh input. Keep the rule and output shape unchanged.

Practice, check, and read the full lesson

Use the notebook to try the steps. Use the article when you need the longer explanation.

1. Build

Run the small example.

Inspect each step.

2. Change

Try the fresh input.

Keep the goal clear.

3. Check

Compare with the source.

Keep mistakes visible.

Try the second topic as a fresh input. Keep the rule and output shape unchanged.

Read the complete tutorial breakdown for this section in our KGP Talkie article.

> A placeholder name is a Python input key. It is not a new fact the model learns forever.
