DAY 26 · THEORY HANDOUT

Build a Chatbot Students Can Use

Turn prompts, streaming, and history into a small web app.

The idea and its useful terms

Turn prompts, streaming, and history into a small web app.

Streamlit

A Python tool for building a small browser app.

Session state

Values kept during one browser session.

Streaming reply

Display chunks before the full reply is ready.

A notebook is good for seeing each step. A chat page lets a learner type a new question without editing code.

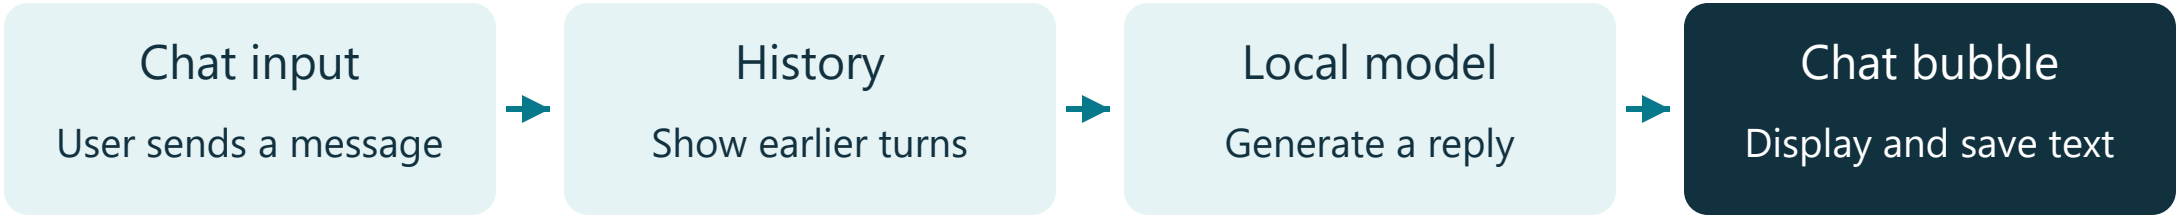

Streamlit reruns the script when the user interacts. Session state keeps the visible messages between those reruns.

> A chat interface does not add knowledge. It shows the model and history we already built.

Follow the work, one step at a time

Each step has a job. We can inspect its output before moving on.

Read the path from left to right.

Each arrow means: pass the result to the next step.

When a user sends text, Streamlit reruns the app script. Session state holds the existing messages. The app redraws them, adds the new user message, and sends the chosen history to the local model.

The app displays incoming reply chunks and saves the completed assistant turn. The clear button resets this browser chat. If model history and displayed history differ, the user may see facts the model never received.

> If the answer is wrong, inspect the input and the intermediate results. The last sentence alone cannot show which step failed.

A small example we can check

The values here are classroom examples. The notebook shows actual results.

First visit

Start with an empty list.

Show a chat input box.

Next message

Add the user turn.

Stream the assistant turn.

Clear button

Clear this chat's messages.

Begin a fresh question.

Read the given input first. Point to the fact or value needed for the requested output.

Run the matching example, then try the fresh input at the end of the notebook. Compare both results with the known input.

> A chat interface does not add knowledge. It shows the model and history we already built.

Choose the setting or tool for its job

A different choice changes the work. These are the choices we compare.

Display history

Chat bubbles on the page.

Keep the roles visible.

Model history

Messages actually sent.

It must match the chat.

Private session

Keep each user separate.

Do not use one global list.

Run the provided app from the repo environment. Ask two related questions.

Clear the chat and ask the second question again.

> Compare visible bubbles with the actual message list in the notebook exercise.

Practice, check, and read the full lesson

Use the notebook to try the steps. Use the article when you need the longer explanation.

1. Build

Run the small example.

Inspect each step.

2. Change

Try the fresh input.

Keep the goal clear.

3. Check

Compare with the source.

Keep mistakes visible.

Compare visible bubbles with the actual message list in the notebook exercise.

Read the complete tutorial breakdown for this section in our KGP Talkie article.

> A chat interface does not add knowledge. It shows the model and history we already built.
