DAY 29 · THEORY HANDOUT

Read Word, Excel, and PowerPoint Files

Keep document text, table cells, and slide labels clear.

The idea and its useful terms

Keep document text, table cells, and slide labels clear.

Word document

Paragraphs and tables stored in a DOCX file.

Spreadsheet

Rows, columns, and cells stored in an XLSX file.

Presentation

A set of slides stored in a PPTX file.

Different files store information in different ways. A matching reader keeps the important structure instead of treating the file as random bytes.

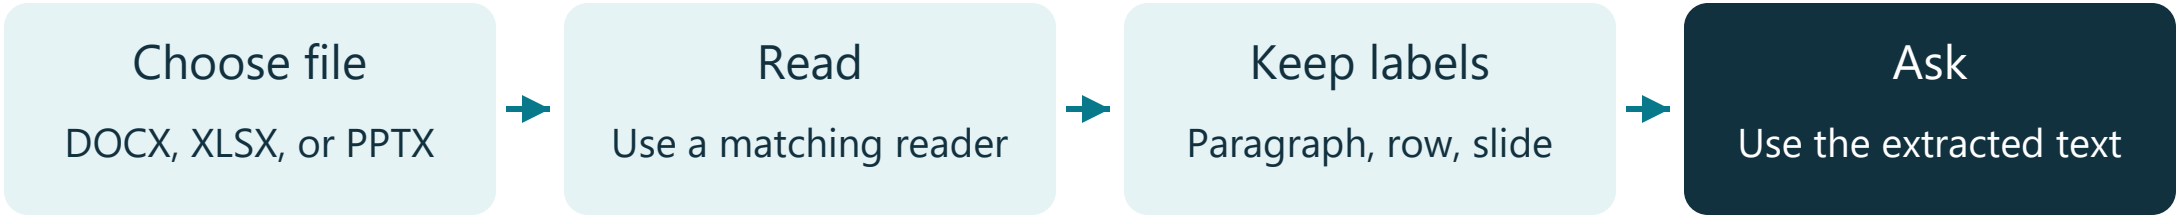

An LLM can describe a table, but Python should calculate totals. We compare its written summary with the actual computed number.

> File conversion can lose charts, formulas, or reading order. Inspect the extracted result before using it.

Follow the work, one step at a time

Each step has a job. We can inspect its output before moving on.

Read the path from left to right.

Each arrow means: pass the result to the next step.

Word paragraphs, spreadsheet cells, and slide text boxes need different readers. Preserve labels while converting them to text. For example, a slide number tells us which teaching point a speaker note belongs to.

For a sales table, Python adds the amount cells and gives the model the computed total. Spreadsheet formulas may need saved results from a spreadsheet program. A text reader cannot recreate every chart or formula.

> If the answer is wrong, inspect the input and the intermediate results. The last sentence alone cannot show which step failed.

A small example we can check

The values here are classroom examples. The notebook shows actual results.

Word

A short job description.

Extract paragraphs.

Excel

Two rows of workshop sales.

Add amounts in Python.

PowerPoint

Two teaching slides.

Keep slide numbers.

Read the given input first. Point to the fact or value needed for the requested output.

Run the matching example, then try the fresh input at the end of the notebook. Compare both results with the known input.

> File conversion can lose charts, formulas, or reading order. Inspect the extracted result before using it.

05 KGP Talkie

Choose the setting or tool for its job

A different choice changes the work. These are the choices we compare.

Text task

Summarize a paragraph.

Send its words.

Number task

Calculate an exact total.

Use Python first.

Slide task

Draft speaker notes.

Keep one slide per section.

Open all three supplied local files with their matching readers.

Calculate the spreadsheet total in Python before asking for a summary.

> Try a new row or paragraph. Check whether the extracted structure remains clear.

Practice, check, and read the full lesson

06 KGP Talkie

Use the notebook to try the steps. Use the article when you need the longer explanation.

1. Build

Run the small example.

Inspect each step.

2. Change

Try the fresh input.

Keep the goal clear.

3. Check

Compare with the source.

Keep mistakes visible.

Try a new row or paragraph. Check whether the extracted structure remains clear.

Read the complete tutorial breakdown for this section in our KGP Talkie article.

> File conversion can lose charts, formulas, or reading order. Inspect the extracted result before using it.
