DAY 43 · THEORY HANDOUT

Build a Resume Upload App

Upload a PDF, inspect text, parse fields, and download JSON.

The idea and its useful terms

Upload a PDF, inspect text, parse fields, and download JSON.

File upload

A user sends file bytes to the app.

Preview

Show extracted text before using the model.

Download button

Let the user save the checked output.

An app lets a user try a new resume without changing a notebook path. A text preview makes empty or broken extraction visible.

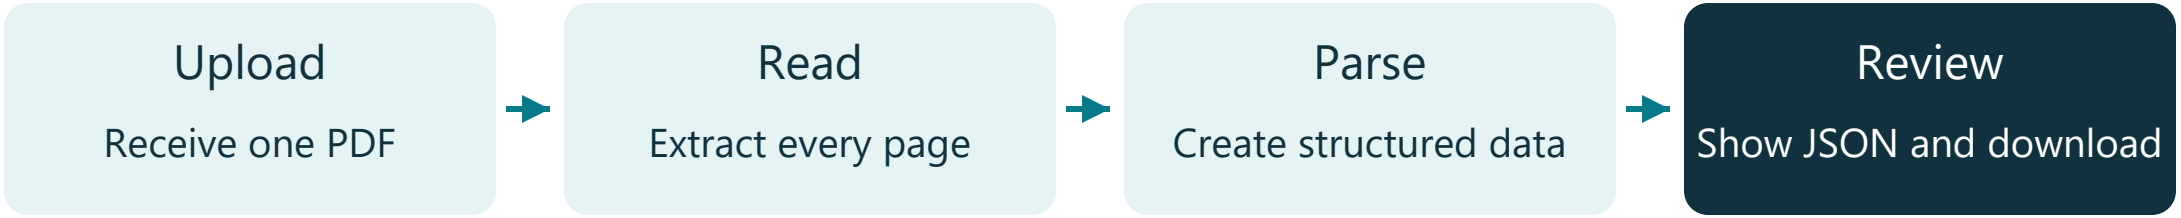

The model call should run after a user action. Repeated script reruns should not repeat an expensive parse by accident.

> A working upload screen needs input checks and honest errors as well as a successful model reply.

Follow the work, one step at a time

Each step has a job. We can inspect its output before moving on.

Read the path from left to right.

Each arrow means: pass the result to the next step.

The uploader returns file bytes. The app checks a small size and page limit, extracts every page, and shows a preview. Only the parse button sends that text to the model, avoiding a call on every rerun.

The app shows JSON after a successful parse and offers it as a download. A new upload gets a new preview. An empty or unreadable text file needs an honest message before we attempt field extraction.

> If the answer is wrong, inspect the input and the intermediate results. The last sentence alone cannot show which step failed.

A small example we can check

The values here are classroom examples. The notebook shows actual results.

PDF upload

A local fictional resume.

Bytes stay in this run.

Text preview

Read what the model sees.

Check page 2 is present.

Output

Show named fields.

Download a JSON file.

Read the given input first. Point to the fact or value needed for the requested output.

Run the matching example, then try the fresh input at the end of the notebook. Compare both results with the known input.

> A working upload screen needs input checks and honest errors as well as a successful model reply.

Choose the setting or tool for its job

A different choice changes the work. These are the choices we compare.

Input limit

A small size/page limit
keeps the demo manageable.

Blank text

Show a clear OCR hint.
Do not parse an empty file.

Missing fields

Keep null visible.
Do not hide uncertainty.

Run the provided Streamlit app and upload the supplied sample.

Check the preview, parse result, and downloaded JSON.

> Try the second resume. Confirm that the old result is not shown as the new result.

Practice, check, and read the full lesson

Use the notebook to try the steps. Use the article when you need the longer explanation.

1. Build

Run the small example.

Inspect each step.

2. Change

Try the fresh input.

Keep the goal clear.

3. Check

Compare with the source.

Keep mistakes visible.

Try the second resume. Confirm that the old result is not shown as the new result.

Read the complete tutorial breakdown for this section in our KGP Talkie article.

> A working upload screen needs input checks and honest errors as well as a successful model reply.
